# Smarter trackers: Real data insights from TrinaTracker's smart control system applications

**Matthew Lynas**  
Editor  
pv magazine

**Sun Kai**  
Head of Smart Control System  
TrinaTracker

**Joe Shangraw**  
Research Associate  
Wood Mackenzie

**Joaquin Fontanet**  
Leader of Technical Sales  
PVcase

# Welcome!

Do you have any questions?  

Send them in via the Q&A tab.  We aim to answer as many as we can today!

You can also let us know of any tech problems there.

We are recording this webinar today. 

We'll let you know by email where to find it and the slide deck, so you can re-watch it at your convenience.  

# Iteration of TrinaTracker Smart Control System and Global Implementations

**Dr. Sun Kai**

Head of Smart Control System, TrinaTracker

# Tracker Global Trend

## The global demand for tracker is keep increasing

Global solar tracker annual installation forecast (GW)

Global solar tracker country shares by major region in forecast period (2024-2030)

### Trackers Tracker configuration

2P two-in-portrait

1P one-in-portrait

Reliable tracker structure and stable operation

Low failure rate

Dealing with extreme weather conditions

Efficient operation and maintenance

Adapt to complex terrain

Reduce power generation losses

- The top 7 tracker manufacturers in the world are all developing their own smart control system, including controller, SCADA, and algorithm.
- Due to the increase in power generation, the usage of SCADA and algorithm is keep increasing.

**Advanced tracker control system**

# TrinaTracker Smart Control System

High  
Reliability

High  
Efficiency

High  
Performance

# Development of TrinaTracker Smart Tracking Solution

## Pain points

Third party controllers' slow responses to fulfillment and after-sales requests.

Maximize the efficiency of bifacial modules.

Complex weather conditions and terrain can cause power generation losses.

The station level SCADA cannot monitor the operation status of tracker.

On-site operation and maintenance rely on manual inspection with low efficiency.

Frequent rain and cloudy weather lead to an unstable power supply for trackers.

Customers have different requirements and preferences for communication and power supply modes.

Need for more precise and stable tracker control.

Photovoltaic power stations require greater power generation, better protection, and lower operation and maintenance costs.

# Latest Pain Points of Photovoltaic Power Plant

## Controller

Better communication applicability, faster response to extreme weather conditions

## SCADA

Flexible login

## Algorithm

More refined shadow optimization

Latest Upgrade Release in 2024

Customers' requirements for trackers have changed.

Power station development is now mostly in remote areas, with a shortage of flat terrain, which leads to small, scattered project sites.

The shading situation may vary in different seasons.

Various extreme weather conditions require prevention of tracker damage.

Project site has a large area or complex terrain, making operation difficult.

Multiple small capacity stations require centralized management.

# TrinaTracker Smart Control System New Upgrade

**TrinaTracker**  
Boosting Power Beyond the Horizon  
**Smart Controllers**

Auto Hail Protection

High Power Output

Electrical Multi-drive for Precise Control

**TrinaSmart Cloud**

## Tracker Level SCADA

### Local Version

Deployment in the central control room with private domain storage on site.

### Cloud Version

Login without limitation, and the operation status of the tracker can be monitored at any time. Multiple station monitoring and management can be performed with one account.

Real Time Monitoring on PC

Remote Parameter modification

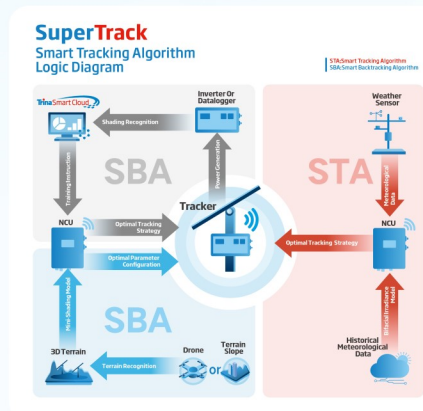

Multiple Station Management

Motor Diagnostic Pre-warning

**SuperTrack**

## Smart Tracking Algorithm

**21MW**

Power Generation Gain, Efficient Operation and Maintenance

## | Smart Tracking Solution - High Operation Efficiency Case

**We have applied Smart Control System to Shandong retrofit project, which has sufficiently improved the efficiency of power generation and operation.**

### **Extremely Inconvenient Transportation**

Located in the midst of mountainous terrain, with a radius of 20 km of barren land

### **Frequent Accidents**

Only one non-paved path to the site, and there are often cars broken-down on the road.

### **Extremely Difficult Operation and Maintenance**

Extremely difficult for operation and maintenance, requiring Smart Control System to monitor the real-time status and improve operation efficiency.

**After providing technical retrofit services for one year, Trina conducted a follow-up visit with the customer and collaborated with SGS to validate the actual power generation gain. Let's take a look at the final results together.**

# PV tracker market trends and smart tracker controls

Joe Shangraw  
Research Associate, Wood Mackenzie

[joseph.shangraw@woodmac.com](mailto:joseph.shangraw@woodmac.com)

November 27, 2024

# Global PV market trends

From Wood Mackenzie's  
2024 Global solar tracker  
landscape report

# Cumulative global PV tracker shipments will surpass 1000 GW<sub>dc</sub> over the next decade

The global market will average 3% growth from 2024-2033, led by demand in Asia Pacific and the Middle East

## Annual PV tracker shipments by region, 2022-2033 (GW<sub>dc</sub>)

# Global ASP for trackers expected to decline by more than 20% over the next decade

Factors include the globalization of the supply chain, larger modules per tracker, and stabilizing steel prices

PV tracker average selling price (ASP) by region, 2022-2033 (US\$/W<sub>dc</sub>)

## Downward cost drivers

- Globalization of manufacturing
- High competition
- Larger and better modules (improves watts/area)

## Neutral cost drivers

- Commodity prices (e.g. steel)
- Drive-train technology

## Upward cost drivers

- Increasingly complex terrain/soil
- Labor-saving joints, foundations, and pre-assembly

# Industry developments in smart tracker systems

## Industry trends in smart tracking algorithms

Several features have become widely available since the rise of advanced control systems

### Advanced backtracking

- Traditional backtracking **avoids row-to-row shading during low sun-angle hours**, based on date and time
- Advanced algorithms learn from sloped terrain and partial shading
- Optimization depends on how many rows each motor controls

Source: TrinaTracker Smart Backtracking Algorithm: SuperTrack Whitepaper

### Diffuse generation

- Considers reflected sunlight from the clouds and ground
- Learns from each site's terrain and albedo (for bifacial modules)
- Responsive tilt adjustments based on real-time weather updates

Source: TrinaTracker Smart Tracking Algorithm: SuperTrack Whitepaper

### Safety and maintenance communications capabilities:

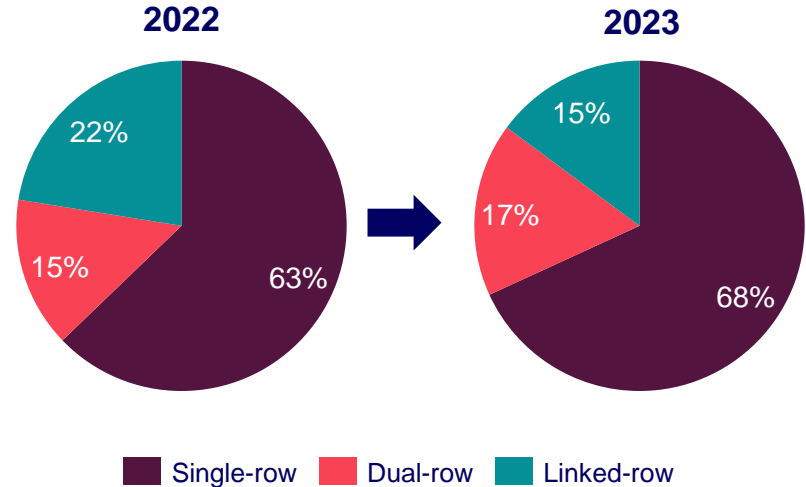

- Automatic wind and hail stow
- Real-time visibility into row-level performance
- **Pinpoint and alert equipment failures** to speed up inspection and maintenance time

## Differentiating between modern tracking control systems

Tracker architecture and model design can influence potential gains in solar production

- **Single-row drive trackers** provide the highest degree of row-to-row optimization compared to dual-row or centralized trackers.
- On-site weather equipment and pyranometers allow for **faster response times** to changes in irradiance and wind speeds.
- Closed-loop control systems that **autonomously and continuously optimize production** will usually outperform similar systems that operate on fixed inputs.

Global tracker architecture breakdown by shipped capacity

# Where can smart tracking systems bring maximum value?

Location and market conditions will affect the demand for smart tracking systems

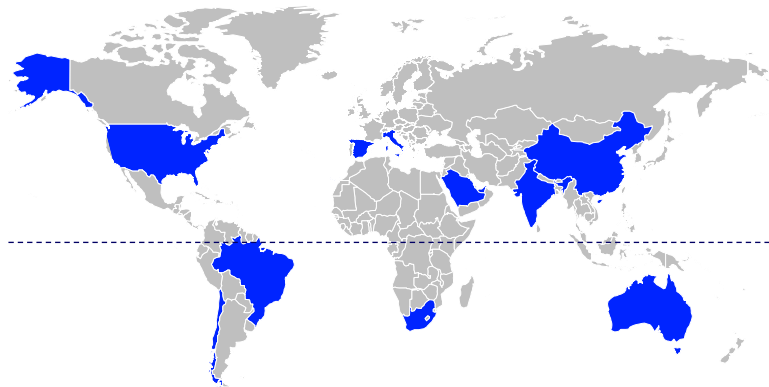

## Geography considerations

- Backtracking can be more effective **in mid/high-latitude regions** with more low sun-angle hours
- Helps justify non-graded projects on **complex terrain**
- Boosts production in regions with more **clouds/rain**

## Market considerations

- Does the market favor low CAPEX or low LCOE?
  - Low-CAPEX markets may prefer fixed-tilt or linked-row trackers
- Will improved off-peak generation translate to greater revenue?
  - In high solar penetration areas, **are energy prices more favorable in cloudy and evening hours?**
- **Insurance costs** (Hail and wind-prone regions)

Top 10 global PV tracker markets (2024-2033)

## Extra value at off-peak hours: Looking at California as high PV penetration example

Annual average Southern California day-ahead electricity prices, 2023-2024, (US\$, GW)

SuperTrack vs conventional tracker: Example production curve (with a cloudy afternoon)

## **Digitalization of tracker industry**

Unlocking synergies across the value chain

November 2024

## About PVcase

---

PVcase creates advanced software to break logjams in the engineering and construction of renewable energy projects, making them less labor-intensive, time-consuming, and complicated. **Our technology enables developers to complete projects faster, more efficiently, and precisely – accelerating the global transition to clean energy.**

PVcase is particularly focused on **tackling the problem of “data risk”** caused by data degradation throughout a project. Discrepancies in data from dozens of sources can hamstring a project and cause it to underperform its expected energy output. PVcase ends clunky processes and corrupted data and clears our path to a net-zero economy.

## Vision

---

Accelerate the renewable energy transition by developing the industry’s leading software ecosystem that helps design, analyze, and optimize renewable energy assets globally.

## Mission

---

Fight climate change through software.

# **Trackers Industry Synergies**

# Identifying synergies to address key industry trends

## Trackers for complex terrains

- PVcase GM **integration of new product features that are cost-cutting** for shared customers, in a context where cost for EPC is typically 15% higher due to higher labor cost for grading.

## Agrivoltaic tailored products

- Developing **tailored product solutions** for agro-projects with dedicated features to **unlock the potential of trackers** in both energy and agro yields improvement

## Advanced Tracking Algorithms & AI

- Collaboration between R&D dept. can **speed up innovation roadmap, reduce costs and create a market leading products**

## Bundled and software solutions

- Bundle software solutions, trackers product and after sales services to **provide an integrated service to Developers and EPCs**

In an increasingly complex industry scenario, it's key to align software and hardware development to deliver a complete solutions to the final users

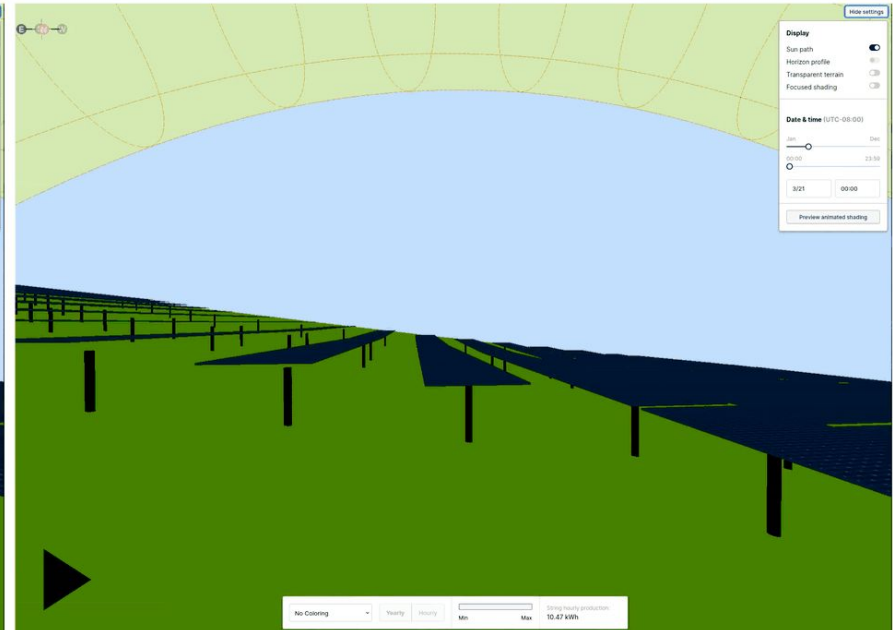

# Trina Tracker & PVcase joint efforts

## Conventional backtracking

## Terrain-aware backtracking

TrinaTracker and PVcase have engaged in a collaborative effort to conduct an independent comparison of their respective tracking algorithms for complex terrains.

# Value creation for the Industry

## TODAY

We can expect software to manufacturer collaborations to:

- Increase accuracy of the algorithms developed by both parties.
- Allow the final users to run consistent iterations across the possible tool and platforms during different stages of the asset lifecycle

## TOMORROW

Broadening the collaboration efforts to include final users:

- Develop tailored solutions based on existing software environments and unique processes
- Increasingly reduce the time to market and bankability of new innovative solutions

Thank you!
